

Supplementary Figure. S1. Average area of testis cord section in the developing testes.

The area of each testis cord was measured and average value amongst grouped ages were calculated. Mean + SD are shown, and sample numbers of each age are represented as the number in parentheses. The horizontal axis represents average area of testis cord section (μm^2) and the vertical axis shows days after birth (pp). Bars labelled with same letters represent values that do not differ significantly by Tukey–Kramer’s multiple comparison test at $p < 0.05$.
